# **Design Report**

#### **Architecture Overview**

The application implements a three-tier architecture with React frontend, Node.js/Express backend, and MySQL database, all containerized using Docker for consistent deployment.

### **Database Design**

- **Users**: Authentication credentials, profile data, role (admin/regular)
- Channels: Programming topic channels with creator reference
- Messages: Questions posted in channels with content and optional images
- Replies: Self-referential structure enabling nested discussions
- Ratings: Record of user votes on messages and replies

Foreign key constraints ensure data integrity and simplify cascading deletions when parent records are removed.

### **Frontend Structure**

- Component-based organization: Reusable UI elements grouped by function
- Context API: Manages authentication state throughout the application
- React Router: Handles client-side navigation between pages
- Responsive design: Bootstrap-based layout adaptive to different screen sizes

## **Key Features & Implementation**

- JWT Authentication: Secure, stateless API authentication
- Code formatting: Triple backtick syntax with language-specific highlighting
- **Nested replies**: Unlimited depth with collapsible threads
- File uploads: Image attachments for messages and replies
- Real-time updates: State management ensuring UI reflects latest data

### **NPM Packages**

Frontend:

- react-router-dom (routing)
- axios (API calls)
- react-bootstrap (UI components)
- react-syntax-highlighter (code formatting)
- react-icons (UI icons)
- date-fns (date formatting)

#### Backend:

- express (web server)
- mysql2 (database driver)
- bcrypt (password hashing)
- jsonwebtoken (authentication)
- multer (file uploads)
- express-validator (input validation)

This architecture balances functionality, security, and maintainability while adhering to modern web development practices and meeting all project requirements.
